Gene expression in hematopoiesis

Gene expression in hematopoiesis

Hematopoiesis

Maturation and Differentiation Chart

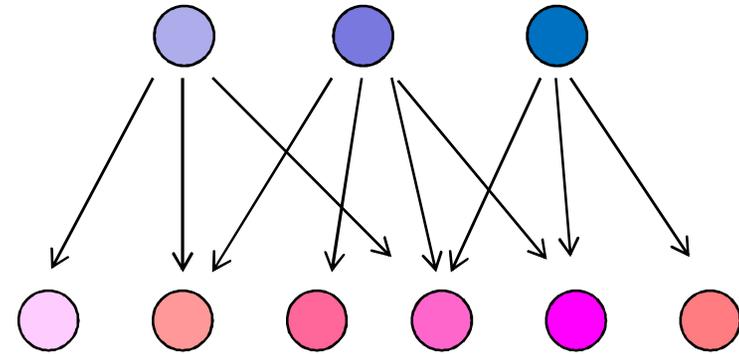

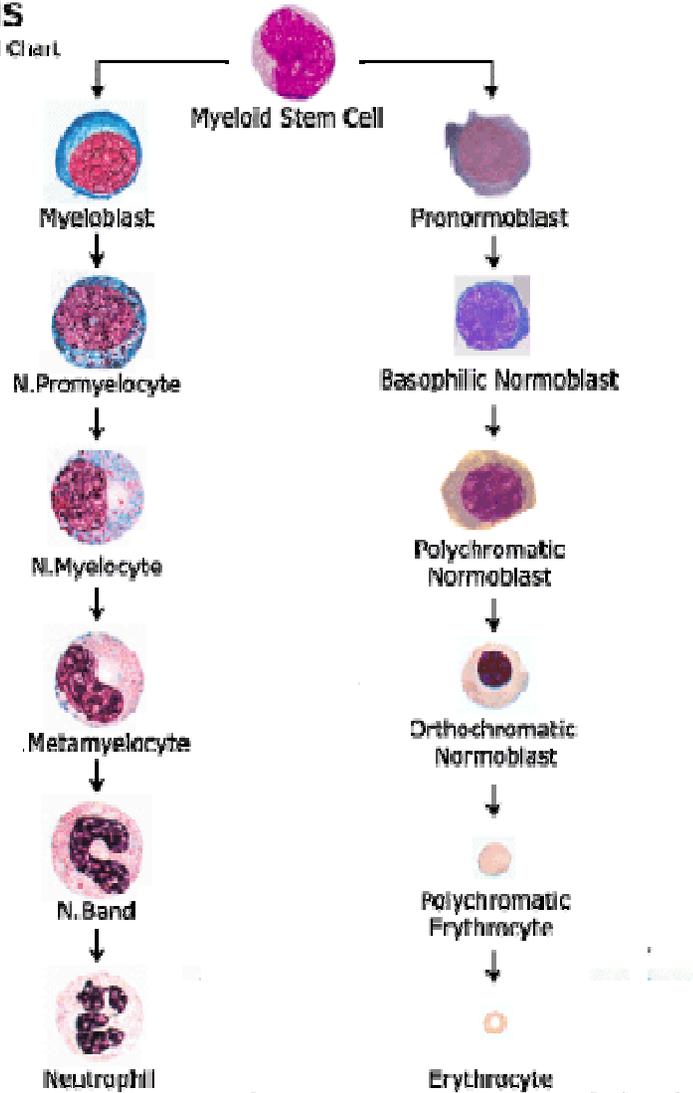

MASTER REGULATORS

- Cell lineages representing discrete “genetic programs” mutually exclusive and intrinsically robust.
- Transcription factors act in intricate circuits of gene regulation, specifying the stable lineage-specific transcriptome.

30 time points
(7 days)

24-36 hrs

Tariq Enver

Experimental setup

a) Microarray data:

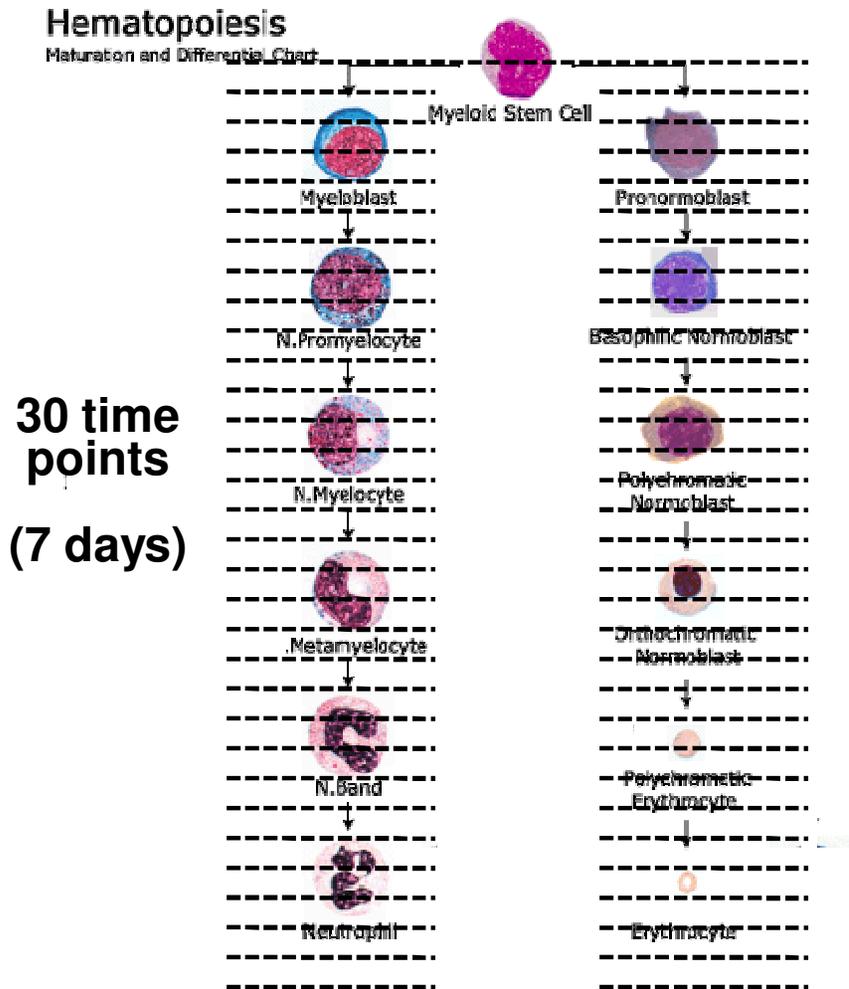

- (N): 3600 diff exp genes (265 TFs)
- (E): 4500 diff exp genes (354 TFs)

b) ChIP-on-chip data:

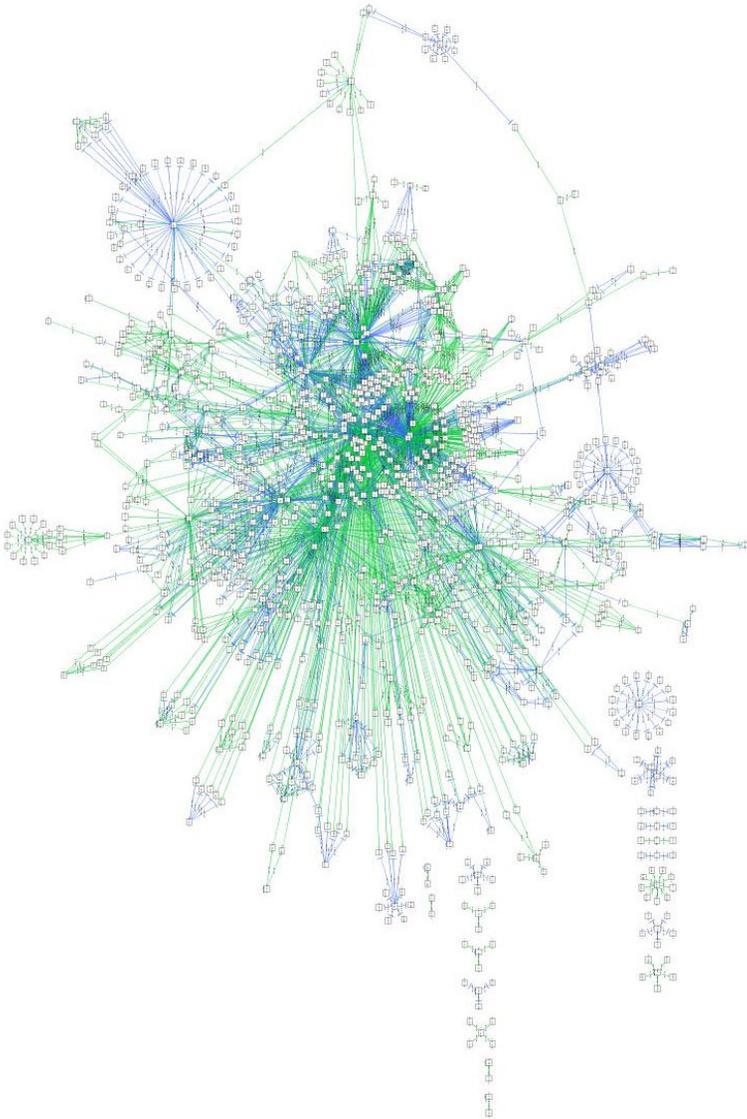

- Key TFs (Gata1, Gata2, Pu.1, Fog-1)

c) Cell population counts (7 time points):

- Blasts (progenitor)
- Immature erythroid
- Immature neutrophils
- Macrophages
- Megakaryocytes

Transcriptional network inference

a) Microarray data:

- (N): 3600 diff exp genes (265 TFs)
- (E): 4500 diff exp genes (354 TFs)

b) ChIP-on-chip data:

- Key TFs (Gata1, Gata2, Pu.1, Fog-1)

c) Cell population counts (7 time points):

- Blasts (progenitor)
- Immature erythroid
- Immature neutrophils
- Macrophages
- Megakaryocytes

Transcriptional network inference

Probabilistic graphical models

(Friedman N, 2004)

Dynamic Bayesian Networks

(Perrin BE et al, 2003)

Probabilistic Boolean Networks

(Shmulevich I et al, 2002)

Mutual Information Based

(Basso et al, 2005)

Microarray + ChIP analysis

(Ernst et al, 2007)

a) Microarray data:

- (N): 3600 diff exp genes (265 TFs)
- (E): 4500 diff exp genes (354 TFs)

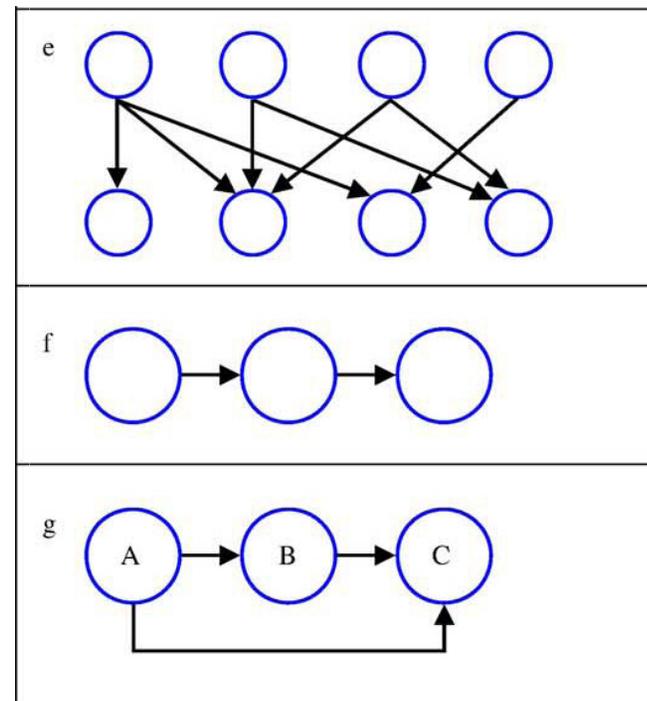

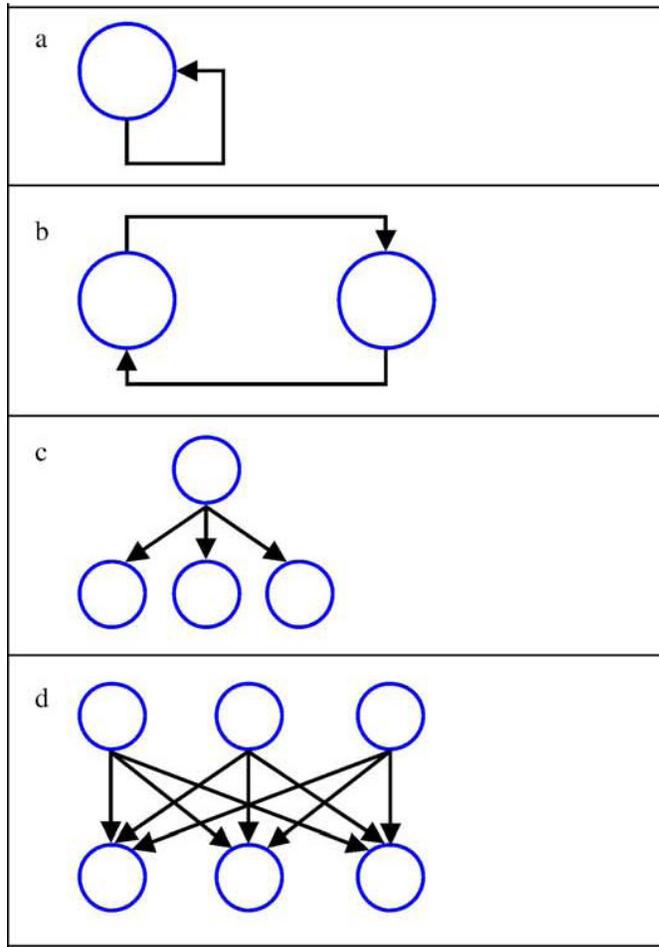

b) ChIP-on-chip data:

- Key TFs (Gata1, Gata2, Pu.1, Fog-1)

c) Cell population counts (7 time points):

- Blasts (progenitor)
- Immature erythroid
- Immature neutrophils
- Macrophages
- Megakaryocytes

Structural motifs

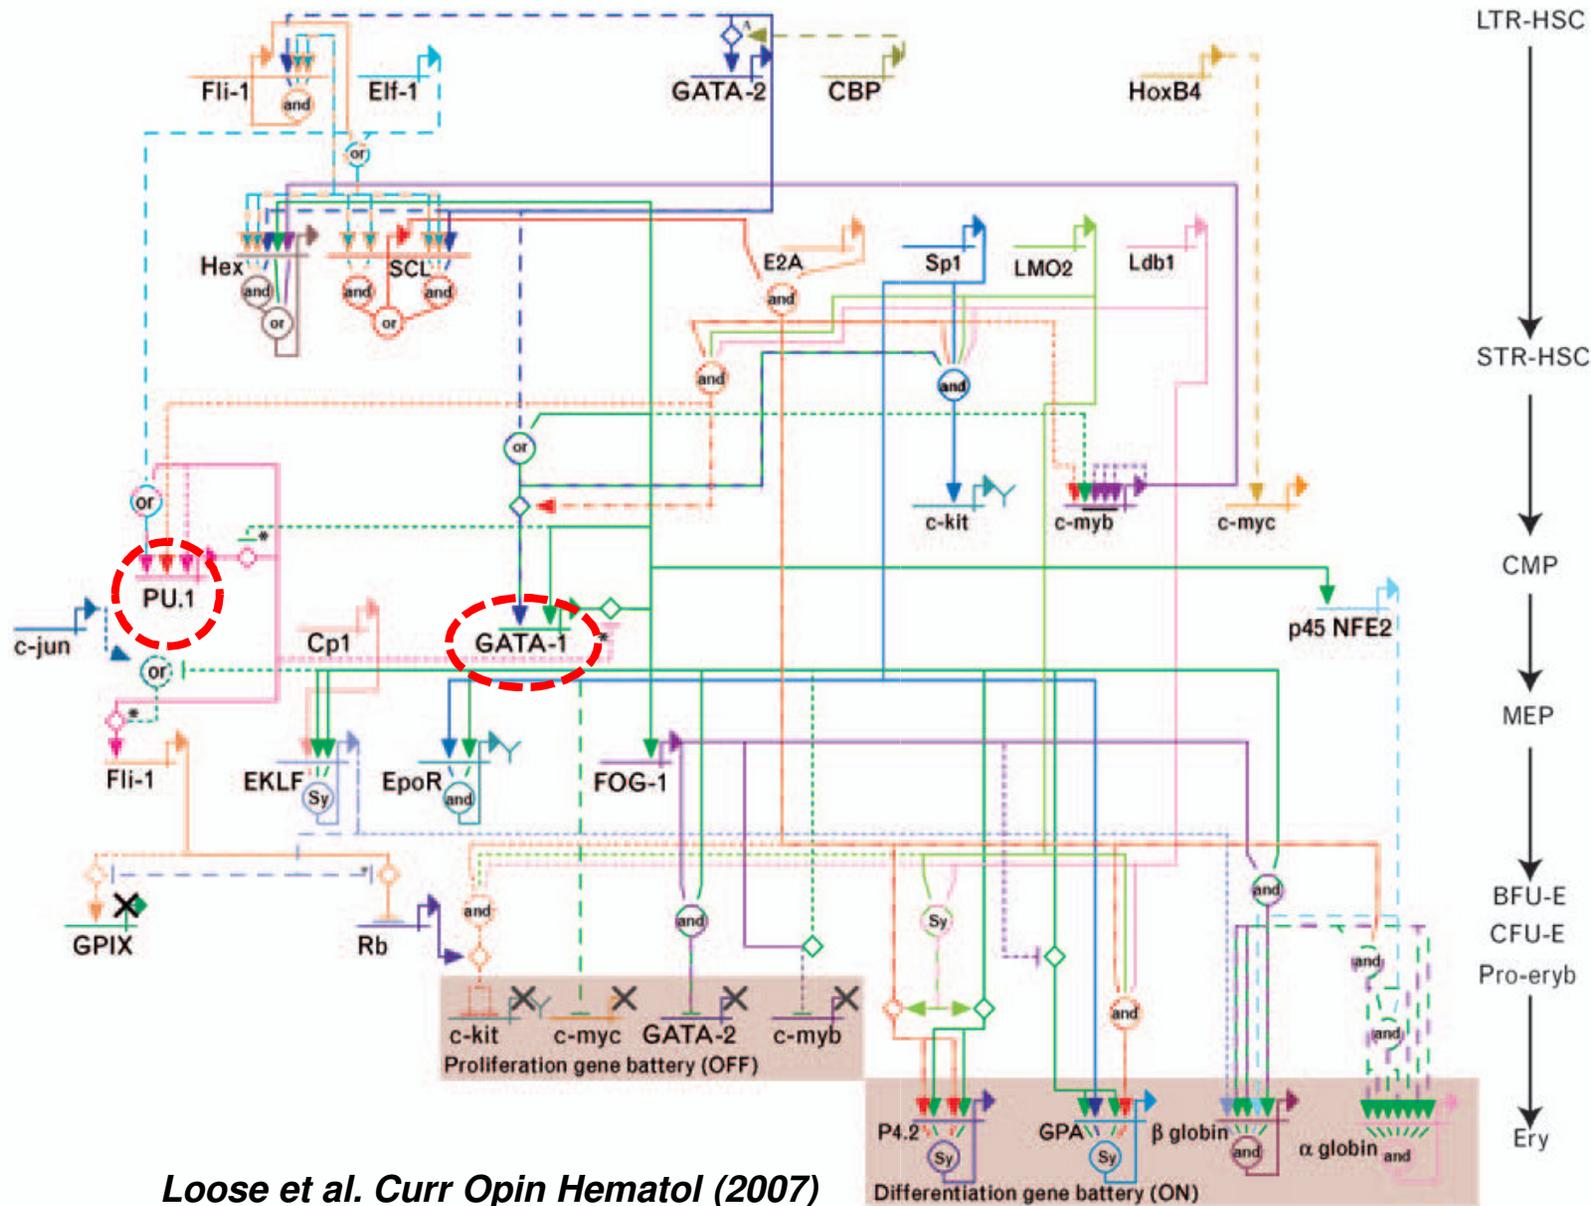

Swiers et al. Developmental Biology (2006)

Dynamical features of hematopoiesis

- Stable attractors of gene circuits represent states of differentiation. (*Cinquin & Demongeot, 2005*)
- The discrete transitions in bistable biochemical systems underlie cell fate decision or differentiation (*Laslo et al, 2006*)
- Control by external regulatory signals (**Enver et al, 1998**):
 - a) Stochastic (“selective”) cell fate control: cell fates constitute preexisting programs adopted by the cell in a chance fashion. External signals act as survival/growth factors.
 - b) Deterministic (“instructive”) cell fate control: external signals impose the program by activating/repressing sets of genes via signal transduction cascades.

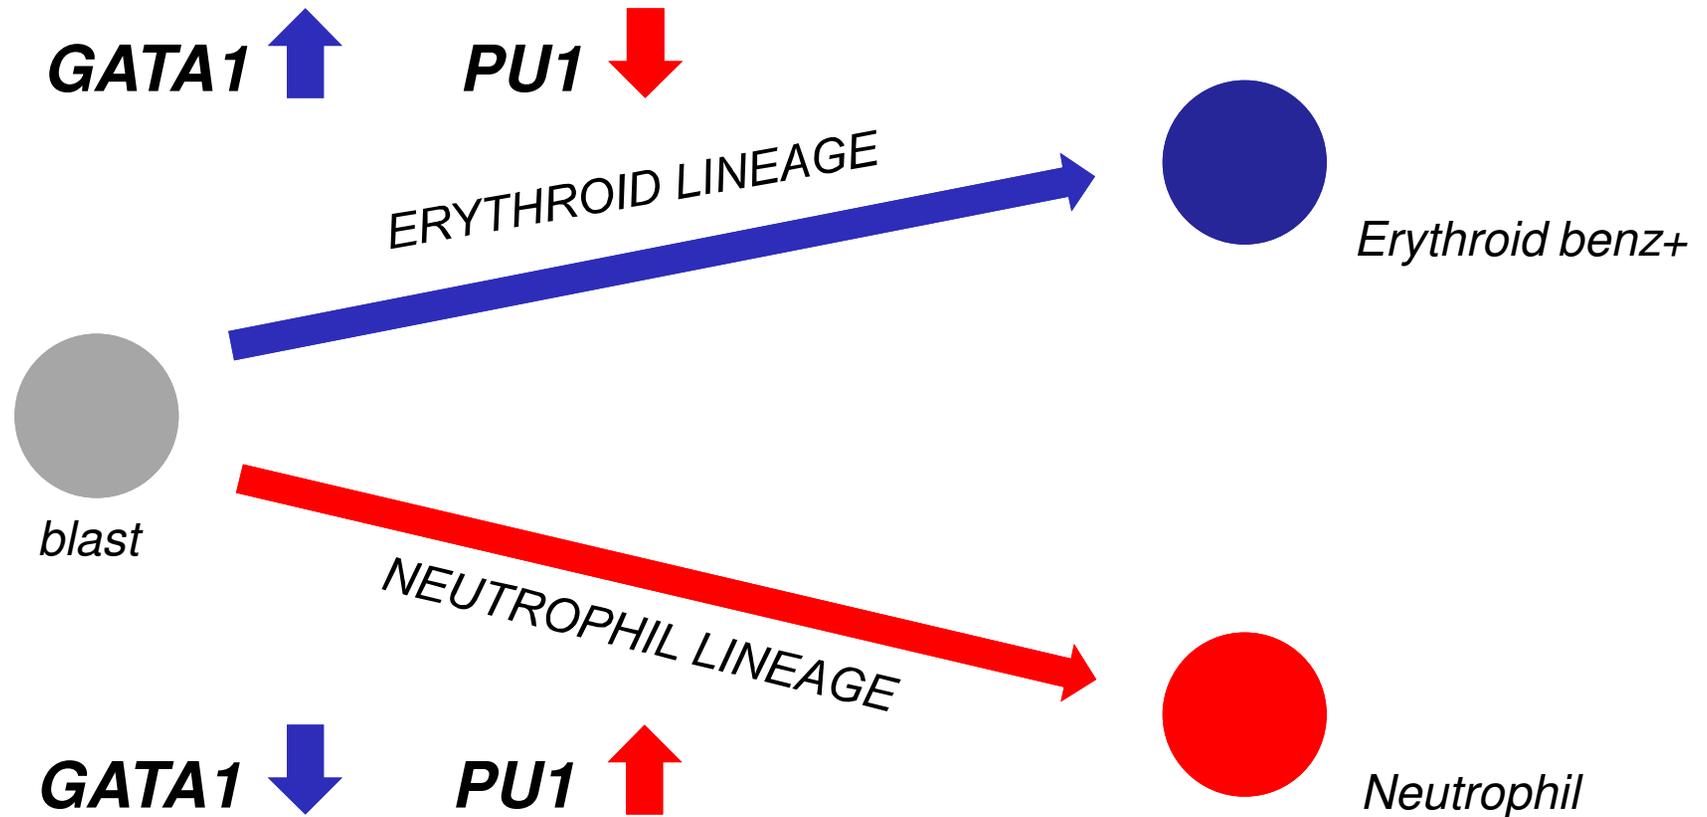

Hematopoiesis as a case-study for genetic control of lineage specification

Dynamical modeling

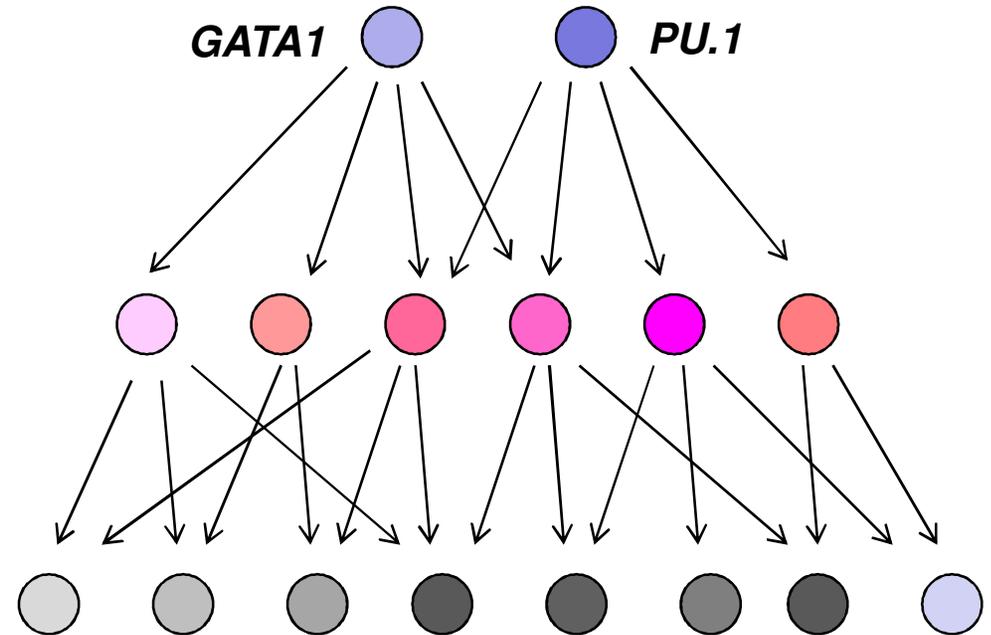

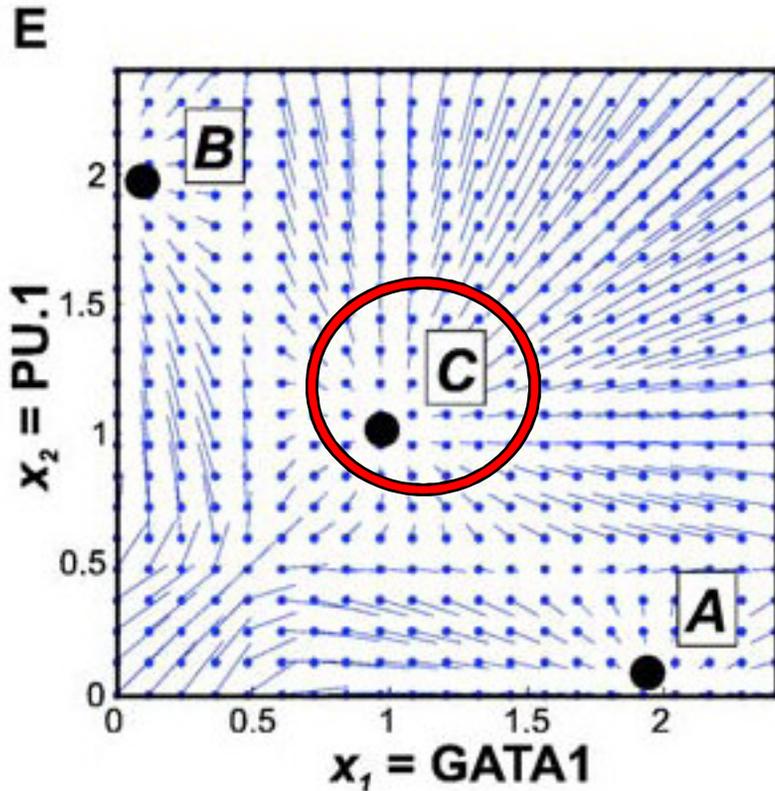

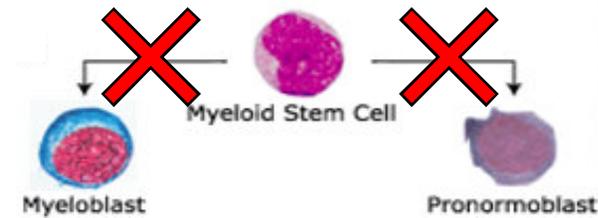

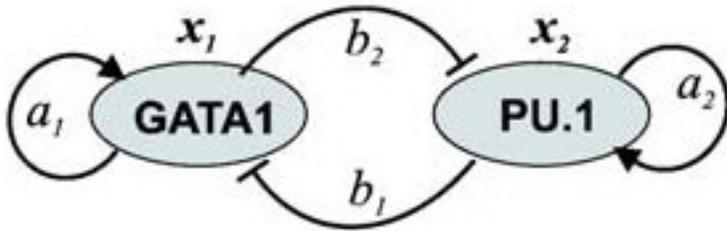

Loose et al. Curr Opin Hematol (2007)

Dynamical modeling: the PU.1 / Gata1 switch

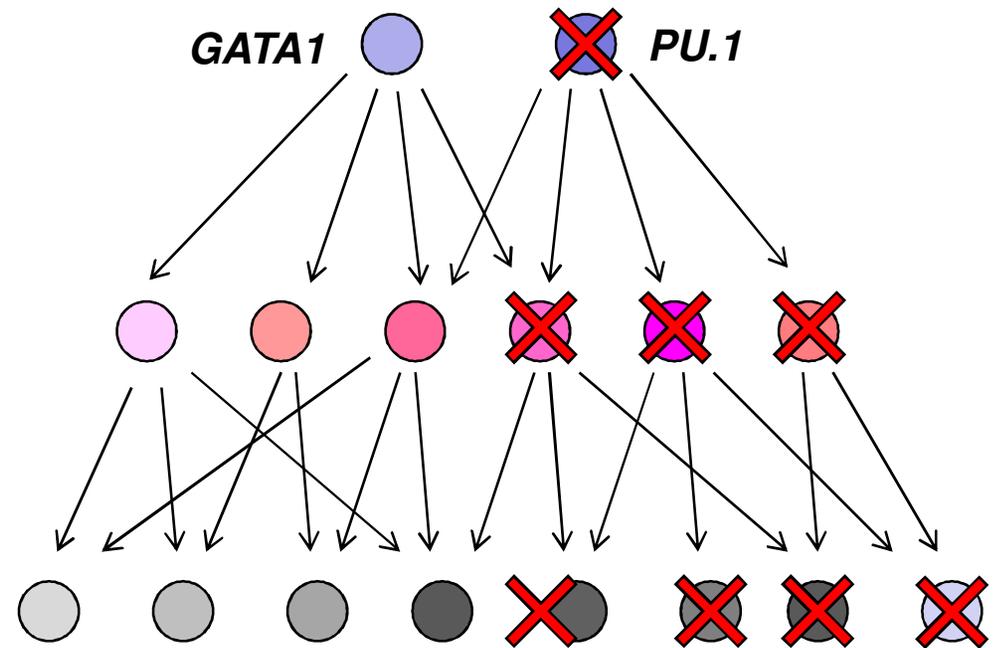

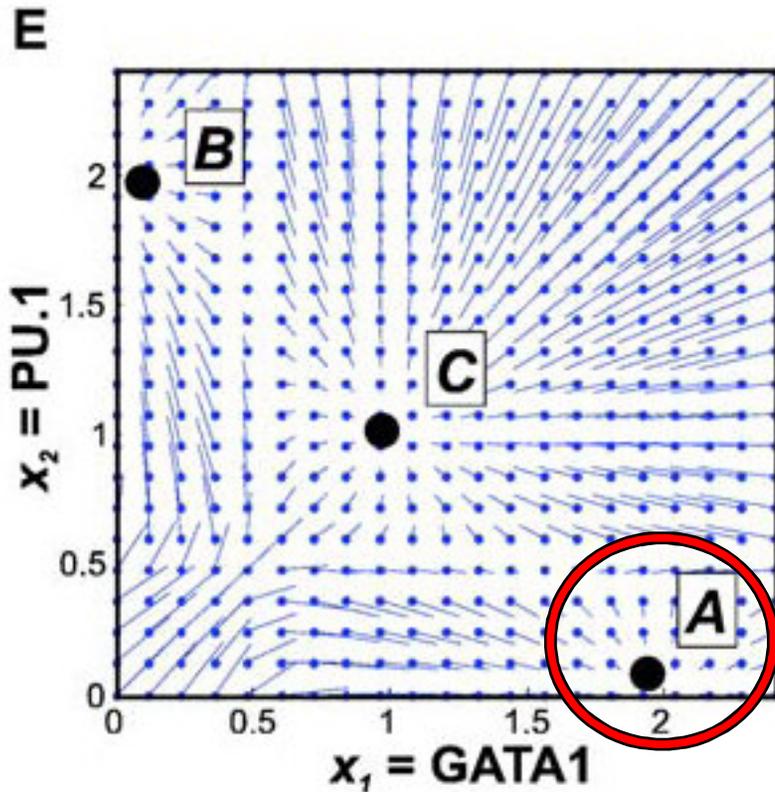

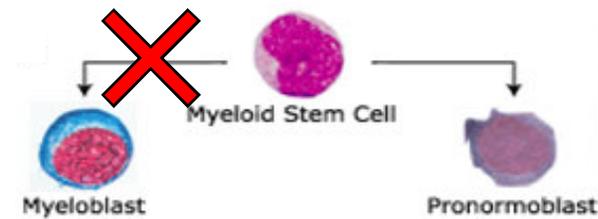

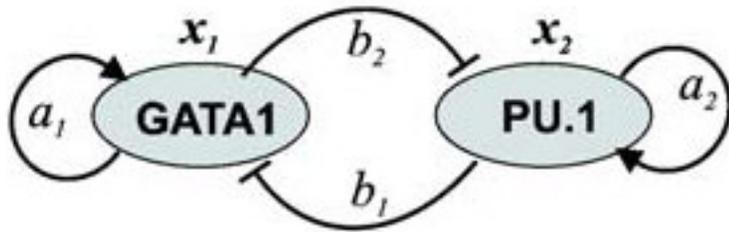

Dynamical modeling: the PU.1 / Gata1 switch

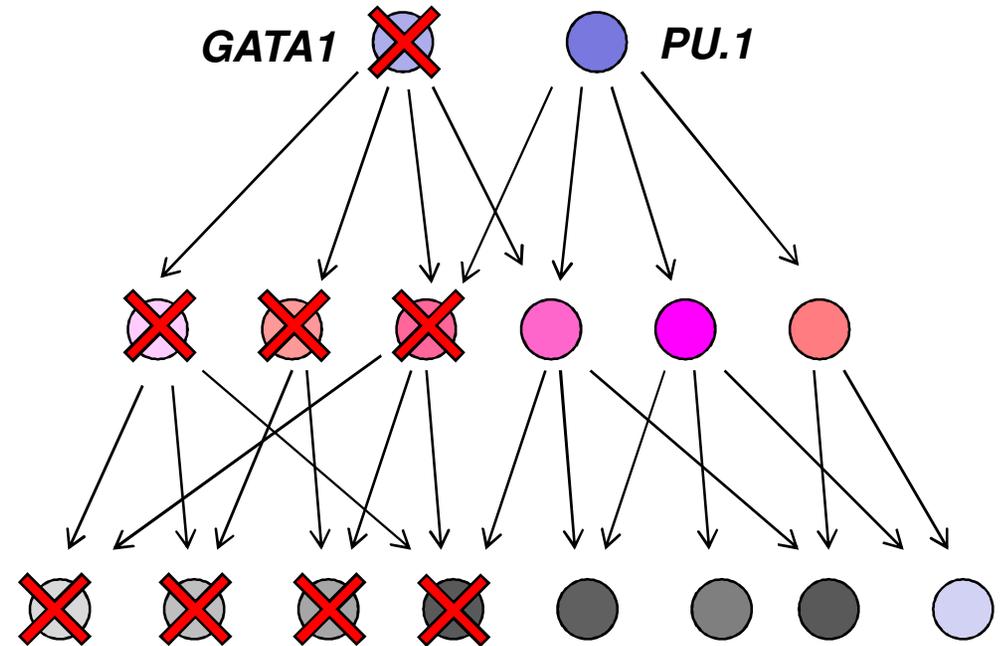

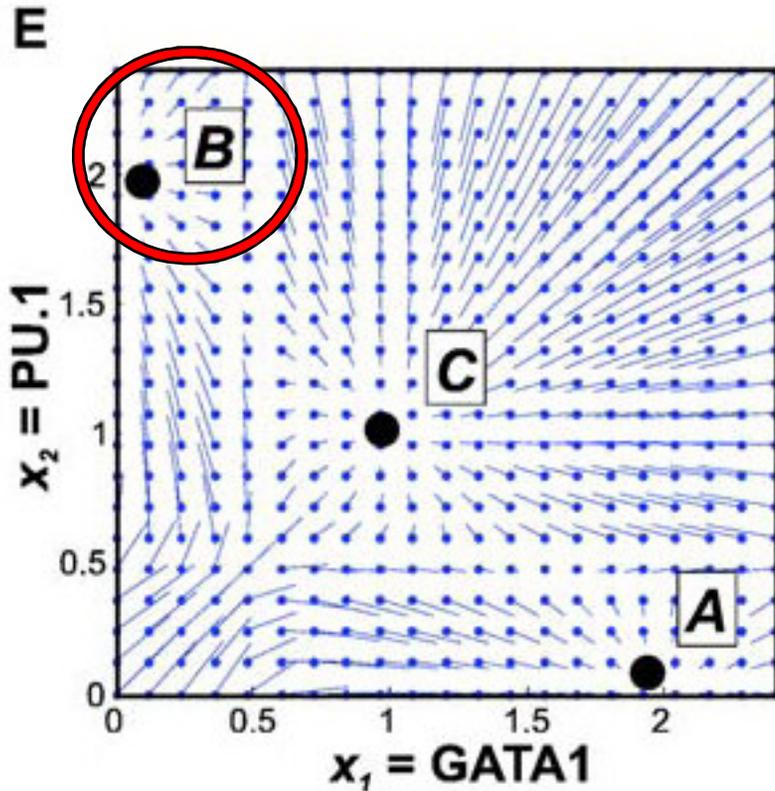

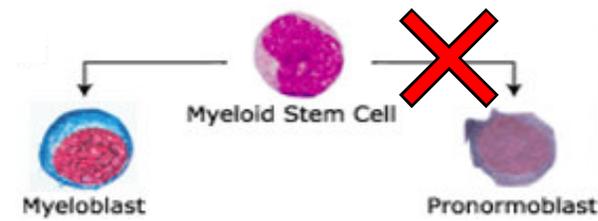

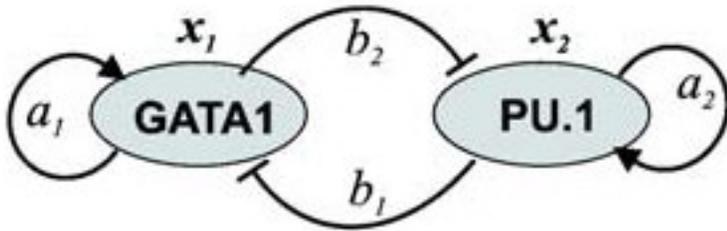

Huang et al. *Developmental Biology* (2007)

Dynamical modeling: the PU.1 / Gata1 switch

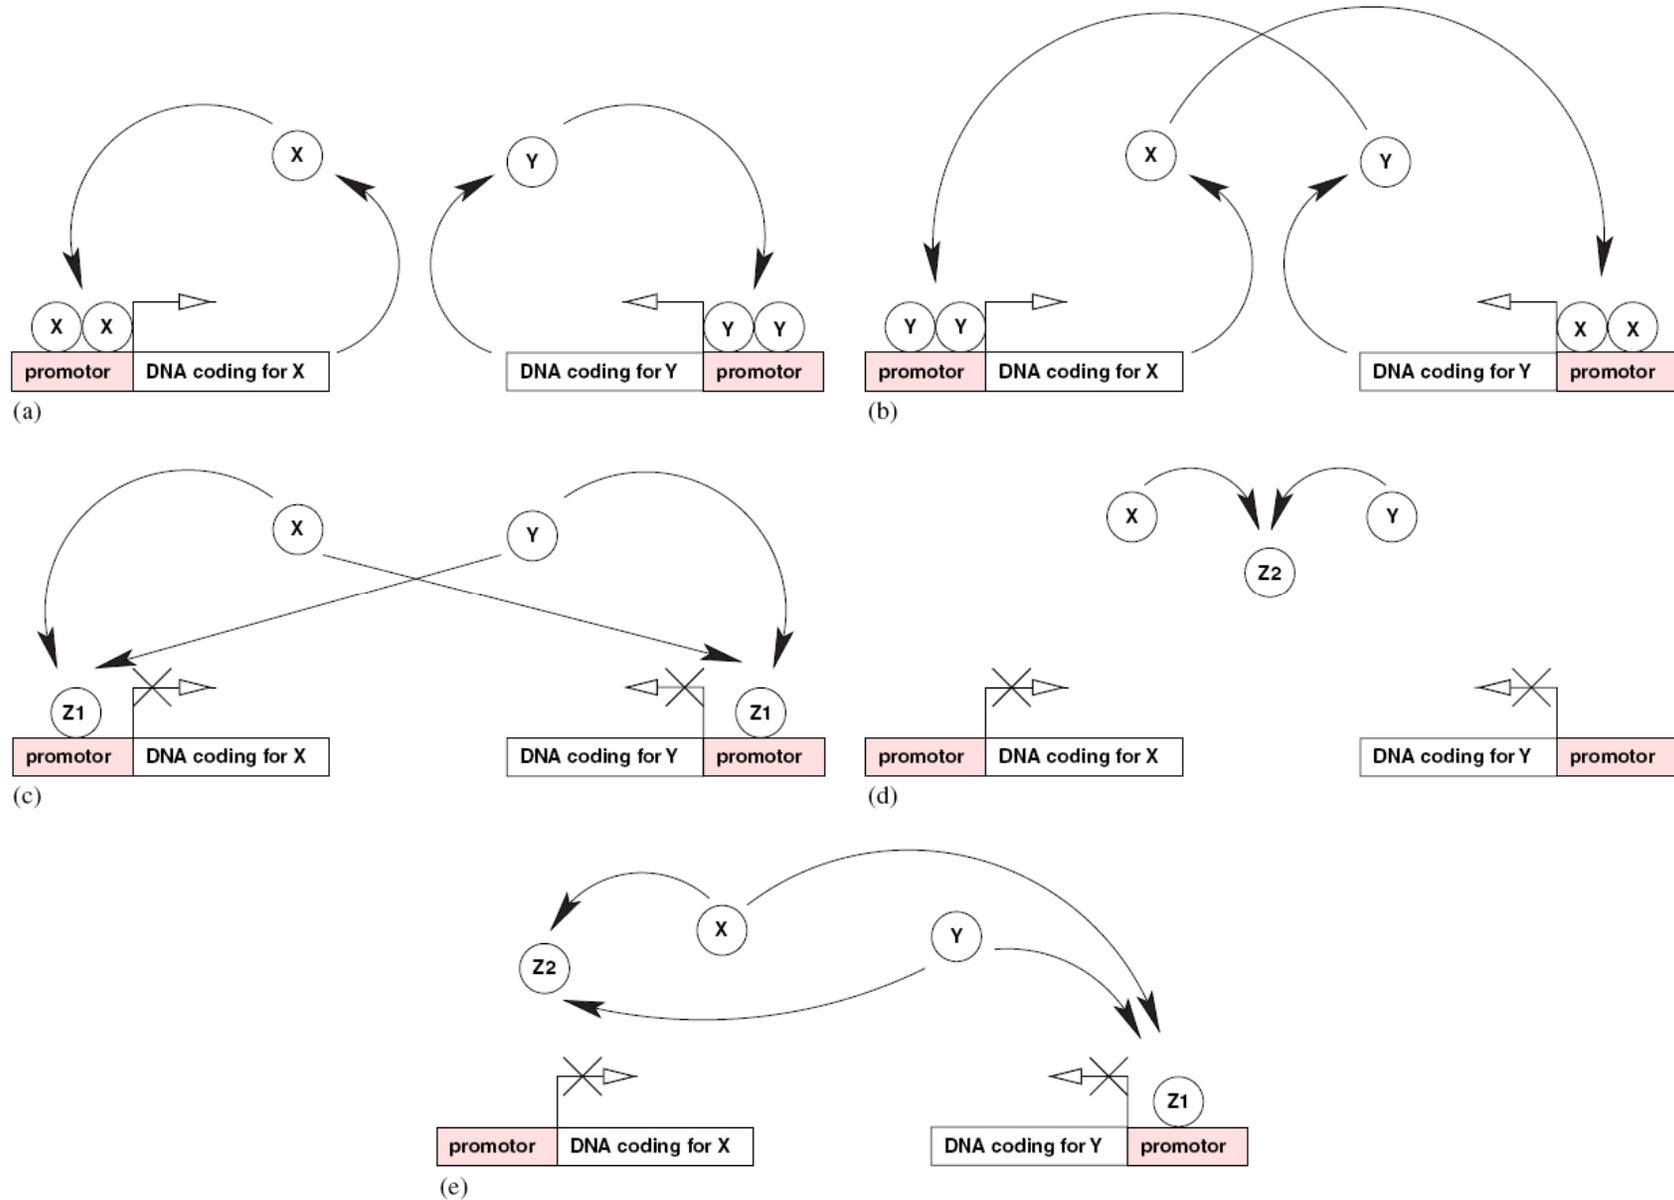

Huang et al. *Developmental Biology* (2007)

Dynamical modeling: the PU.1 / Gata1 switch

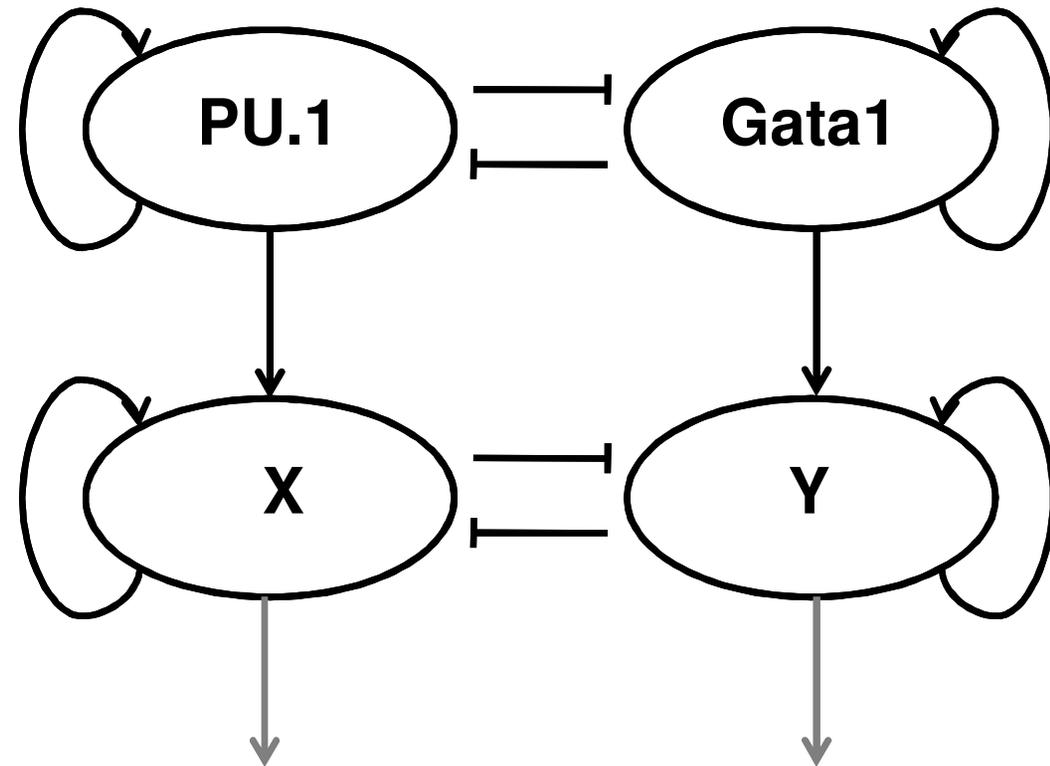

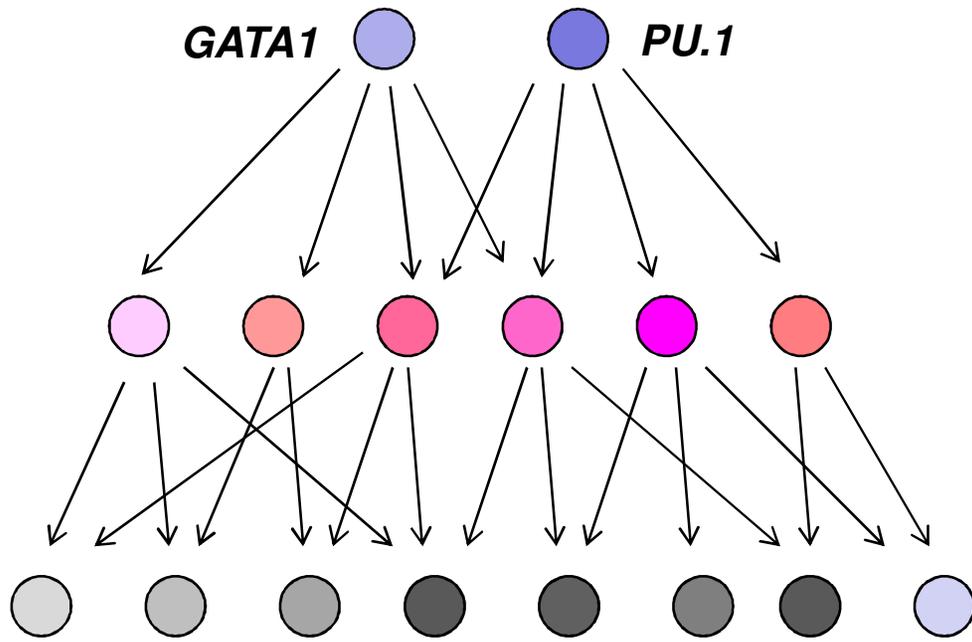

Huang et al. *Developmental Biology* (2007)

Dynamical modeling: the PU.1 / Gata1 switch

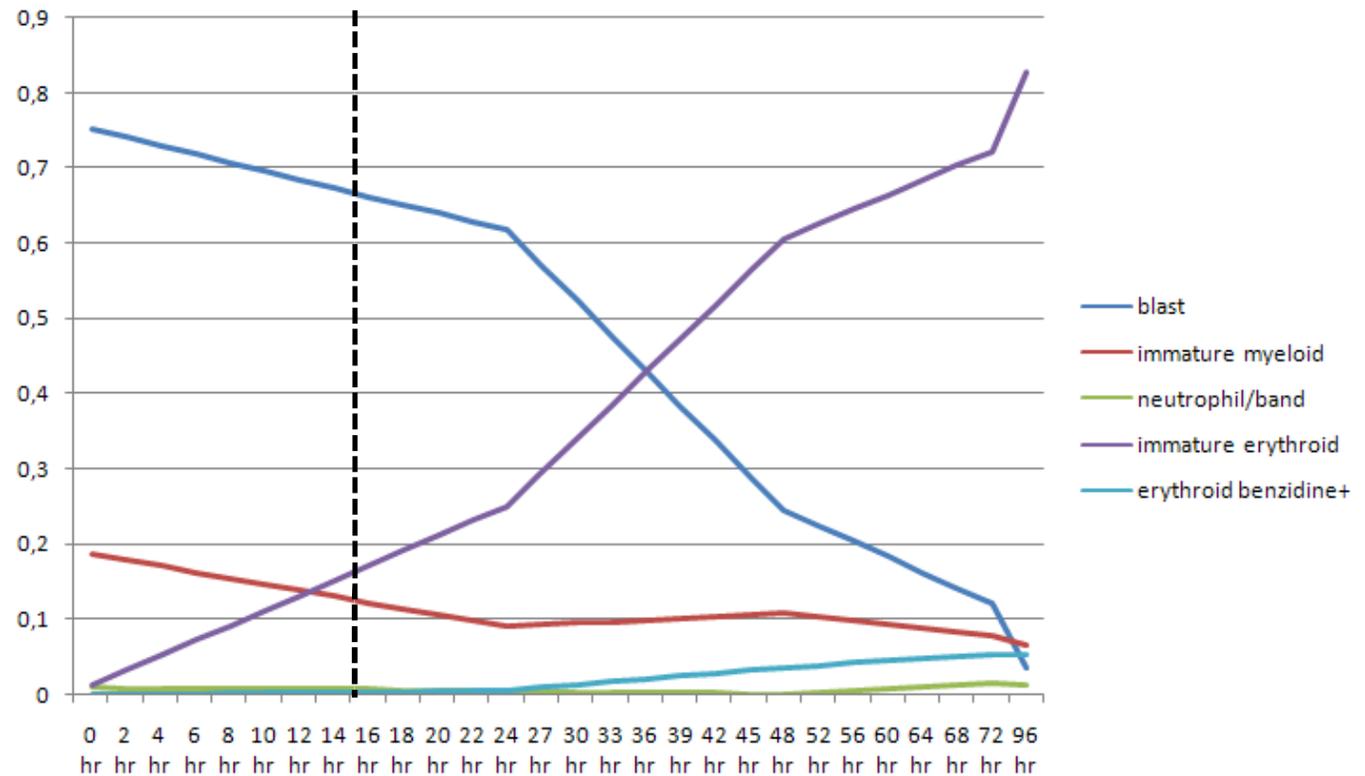

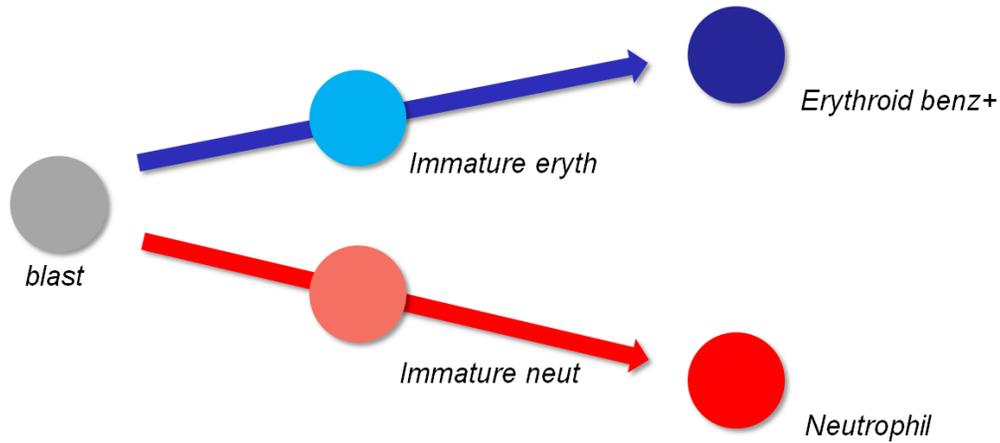

Dynamical modeling: extending the PU.1 / Gata1 switch

Current work

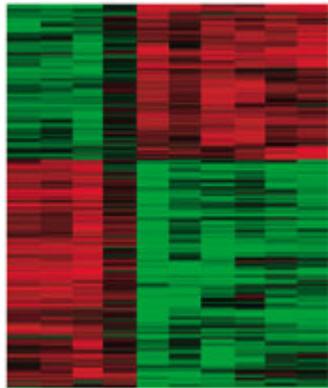

a) *In silico* microdissection of microarray data

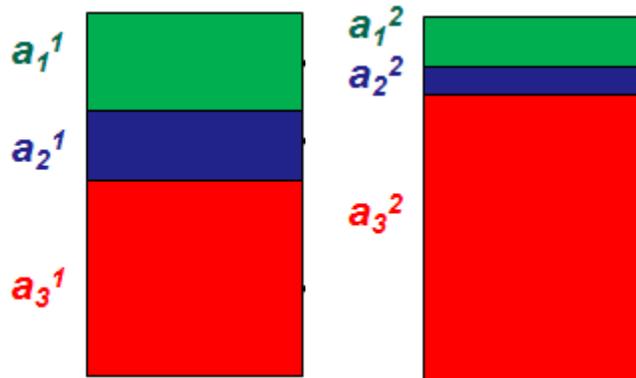

Current work

a) *In silico* microdissection of microarray data

FROM:

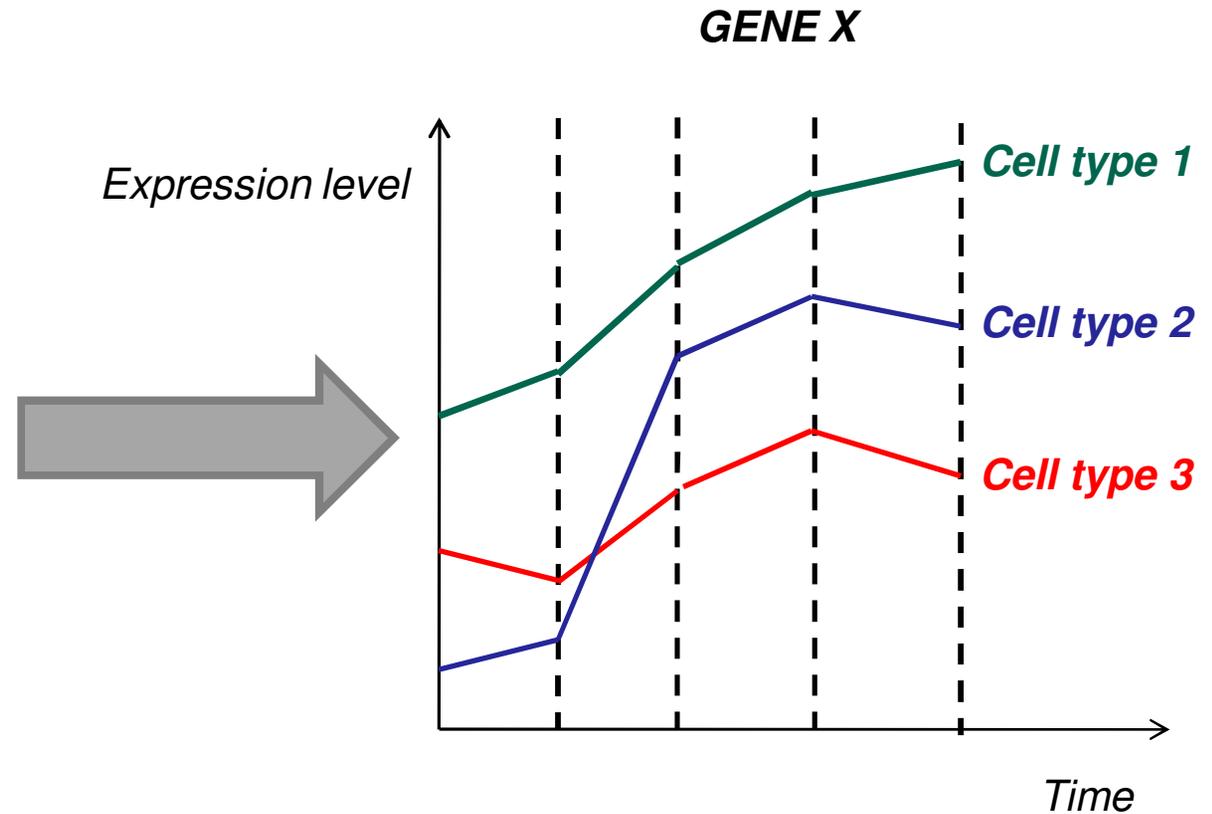

Raw expression data

Cell type fraction measurements

TO:

Current work

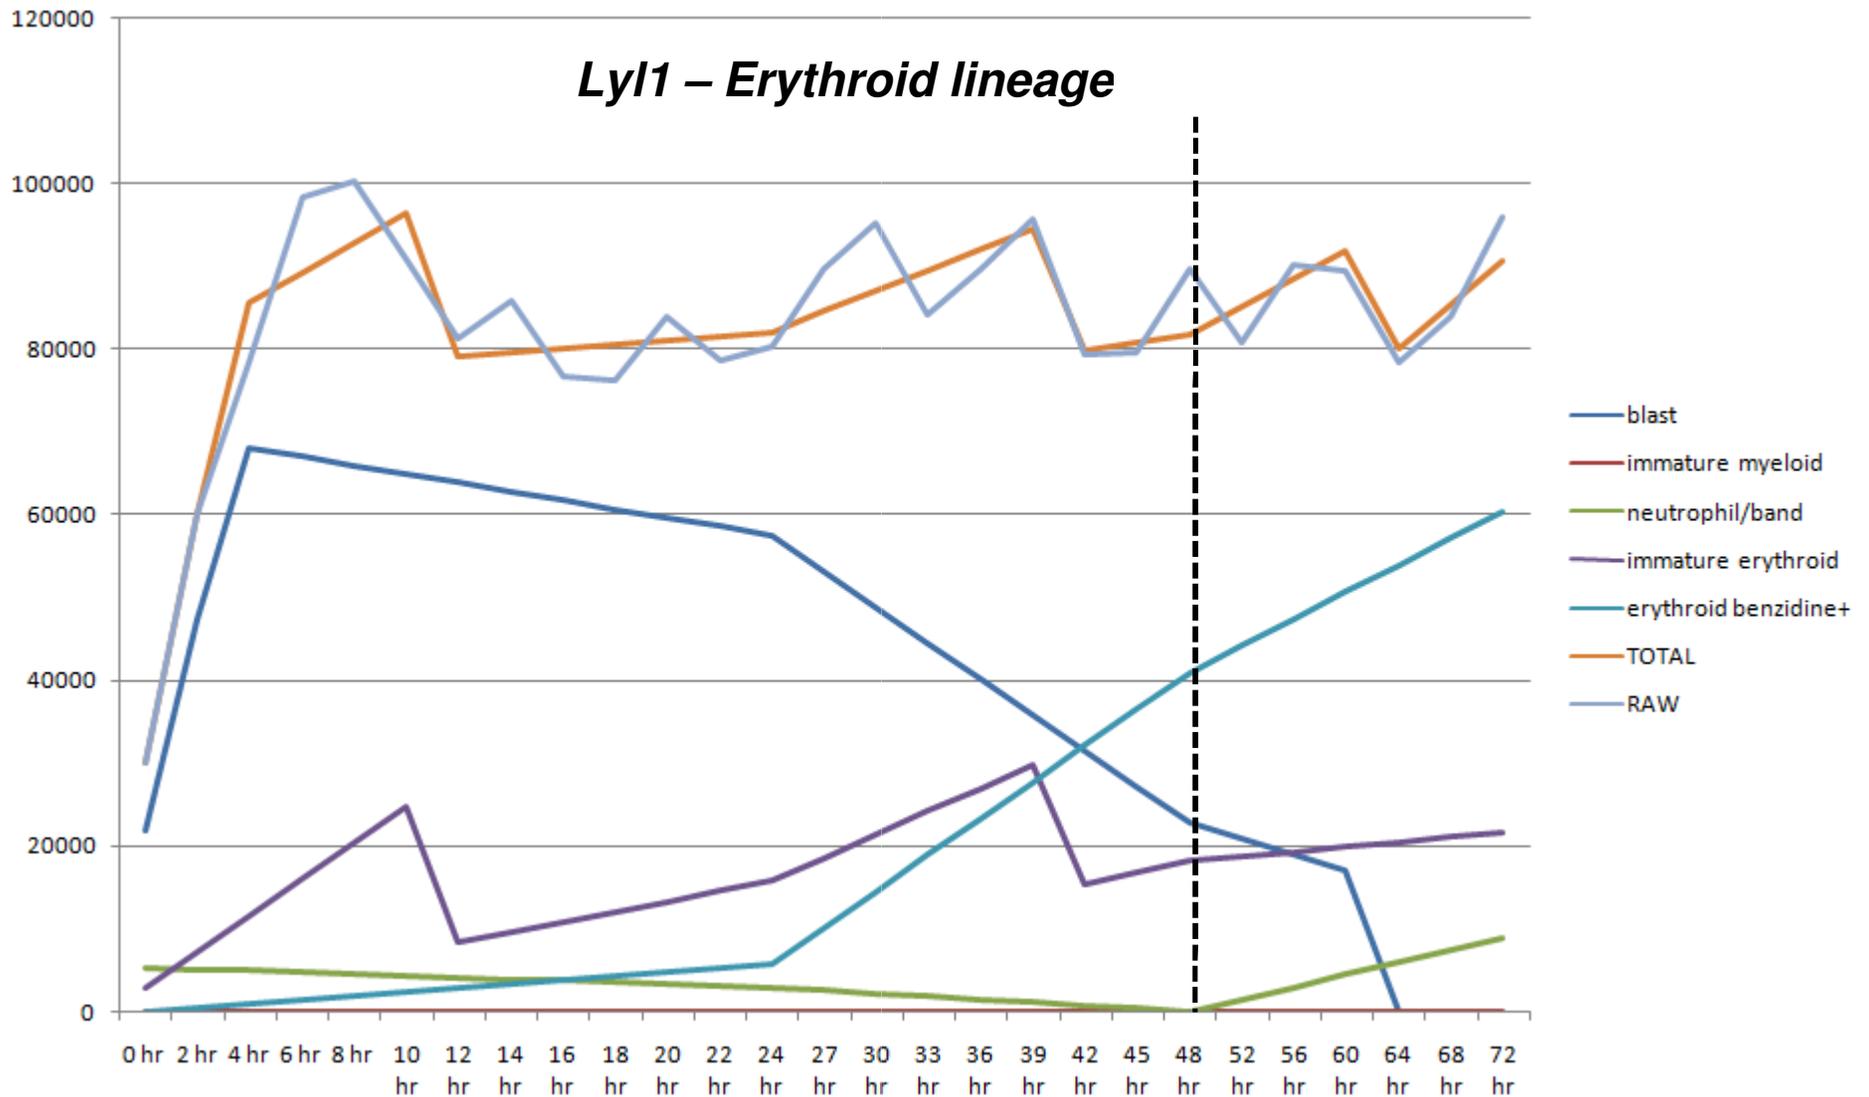

a) In silico microdissection of microarray data

Current work

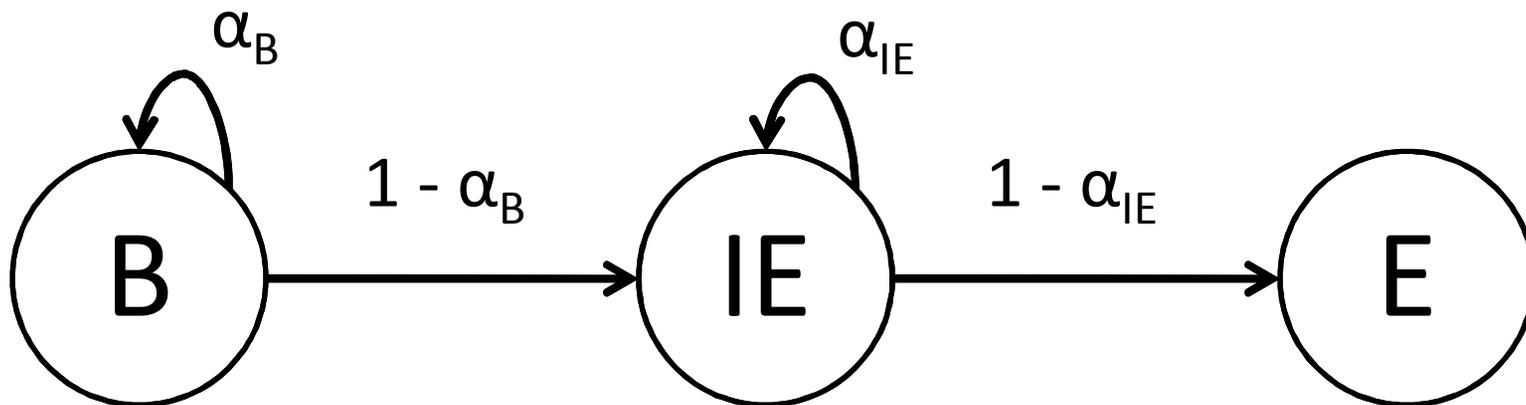

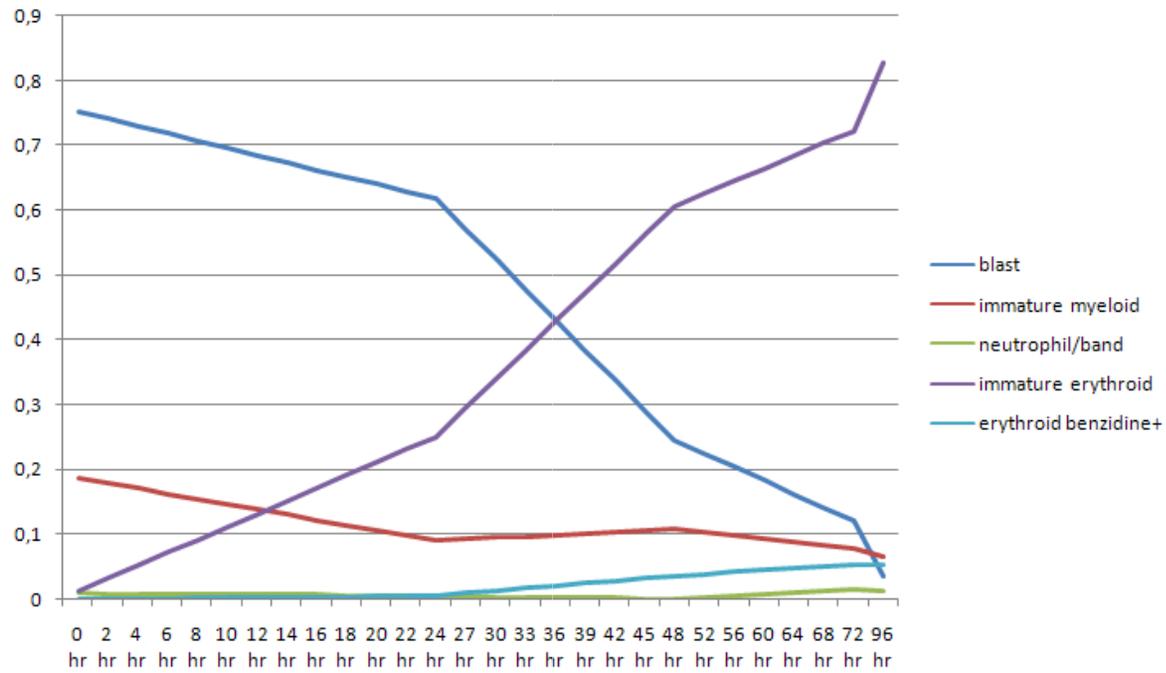

a) *In silico* microdissection of microarray data

OPTIMIZATION PROBLEM: Standard least squares solution as the linear estimate for each one of the cell type-specific gene expression levels

Current work

b) Cell population models

Future work

a) In silico microdissection of microarray data

b) Cell population models

c) Dynamical modeling (Pu.1 / Gata1 ?)

d) Network inference
